

[This matter must not be reprinted without special permission.]

The frequent application of a fifteen cent file to the garden hoe will mean a saving of at least 50 per cent in the elbow grease required to operate it.

A whole lot of hand washing as well as time will be saved the good wife if she will have at hand several pairs of the ten cent cotton flannel gloves for handling wood, coal and the like.

It is questionable which will make greater havoc in a newly made flower bed—a three months' old pup tousling a piece of old rag carpet or a Biddy hunting bugs and worms for a brood of hungry chicks.

Used at the right time when the weeds are small there is no garden tool that will do better execution than one of the old fashioned iron rakes. They cover lots of ground, mellow and stir the soil and expose the roots of the little weeds to the sunshine.

With lumber of all grades increasing steadily in price, clay hollow blocks are coming more and more into use for the construction of the farm buildings. For such purposes they have in their favor lightness, economy of construction, warmth and dryness.

It is a good season to put in the tile necessary to drain that low piece of ground. In fact, any season is a good season. And this holds true whether the succeeding weeks should be wet or dry. If they should be dry the tile would serve to ventilate the soil the better, while if it should be wet they would be of maximum value in making the tract dry enough to till.

There was narrated in the writer's hearing the other day an instance in which a bluejay attacked and killed a full grown sparrow. It seems to have been a case of "dog eat dog." If the jays would only inaugurate a wholesale sparrow killing campaign of this kind and then the small boys get after the bluejays and kill them off two of the worst bird nuisances we have would be disposed of.

The lombardy poplar is a symmetrical and in some ways attractive tree in sections of the west and south where climatic conditions are favorable, but it is sure a forlorn and scrubby looking proposition in the north central states, where it is a case of nip and tuck for it to survive at all and where the growth of one season is often more than half killed back during the succeeding cold winter.

The horse manure pile is the favorite and chief breeding place of the common housefly. Therefore to reduce the number of flies about the place these piles should be kept screened or sprinkled every now and then with air slaked lime, which will make it impossible for the flies to use it as a breeding place. What is said here is equally true of the garbage pile or can or any other place where filth accumulates.

It is quite necessary that the newly set orchard trees should be given thorough cultivation during the present season. Especially is this true in sections where the rainfall is somewhat limited and where it is for this reason necessary to retain the moisture that is in the soil by means of a dust mulch If the trees are given this cultivation they will need no artificial watering except in arid sections—in fact, will be the hardier and better off if they are not watered.

Even though the corn and potatoes may have reached a height of six or eight inches, not only a good job of cultivating, but the best of results in killing small weeds, may be done with a tooth harrow. The work should be done on bright, warm days, preferably in the afternoon, when the stalks are not so brittle as in the morning or as on cloudy or cool days. It is true that the drag may uproot a stalk now and then, but this damage is much more than offset by the amount of territory one can cover in the short time when the weeds are most easily killed in this manner.

With fresh sweet corn relished as it is by so many members of the family, there is no reason why there should not be a continuous supply of the vegetable until frost comes in the fall The early corn and the first plantings of the later varieties have already been provided for. To make the supply constant, as suggested, a couple of rows of the best late variety—the Evergreen—should be planted at intervals of ten days up to the middle of July. The hot spell in August may ruin this, but if the late summer season is favorable it will mean a supply of corn on the cob up to the middle of October. We have tried this plan and know it is worth while.

The good will of another is as often won by asking a favor or service of him as by doing a service for him. The reason for this is that the best in human nature seems to be developed by unselfishness.

Feeding experiments conducted at a number of stations seem to point quite clearly that the best results in feeding grain are got from feeding ground grain dry and wetting grain that is to be fed whole.

A calf should not only have its ration of milk in season, but all the clean water it wants. Many overlook this phase of the calf's ration, which not only results in suffering for the animal, but in a stunting of its growth.

The ideal female figure is the result of exercise. It does not come from reclining in porch chairs or lying in hammocks. Vigorous calisthenic exercises in the vicinity of a mop or broom or over the washboard are activities that develop the most graceful lines.

It is a right good idea not only to wage a fight against the flies indoors, but to carry it into their territory, out on the back porch or even farther from the house. A trap of the kind which has been described in these notes within the past few weeks will catch literally quarts of flies in a day if they are at all plentiful.

In inaugurating fly killing contests in which prizes for the most pounds or quarts of flies delivered during a given period it is a good idea to place a ban on hatching flies merely to be trapped later. In a contest conducted in an eastern city last summer this very thing was done, and it must have served largely to destroy the moral effect of the campaign.

The only reason why greater care should be used in inspecting the quality of cement tile and the character and reliability of the firm making them than in selecting clay tile is that in the former case there is a temptation to be careless in regard to the quality of sand used and in scrimping in the amount of cement. In the manufacture of clay tile this temptation is lacking.

It is more than likely that if an expense account were kept in connection with a good many flocks of hens the end of the year would show mighty little left on the credit side when the cost of feed, labor and interest on the investment had been deducted. There are "star boarder" hens, just as there are "star boarder" dairy cows, and the only way to weed them out is to use some accurate method of keeping track of the cost of their keep and the eggs they lay.

The bureau of animal husbandry of the department of agriculture at Washington has been gathering some data lately relative to the cost of establishing creameries and cheese factories The facts have been put in pamphlet form and include not only plans of organization and buildings, but the list of machinery needed. This bulletin will be furnished those desiring it on making application for it through one's representative or writing directly to the department.

It is largely the type of pruning given the young fruit tree the second and third year after setting that determines the type and shape of head or frame it will have. A tree at this age is very responsive, and hence care should be taken to give it the right start. If the spreading and vase shaped head is desired it can be had by cutting out the leader or main shoot while if the denser and more upright head is desired this should be left in In a general way trees of a quite upright growth should be pruned to outside buds, while those naturally low growing and spreading should be pruned to inside buds.

Many a farmer who wants to protect his buildings from lightning is in a quandary as to whether this can be effectively done by equipping them with lightning rods. This whole question seems to revolve simply on the point of whether the job is properly and carefully done. If it is so done by a reputable firm which has a permanent postoffice address and a satisfactory financial rating there is no question that well nigh complete protection is afforded. On the other hand if some representative of a carpetbag concern works the farmer for a sucker and loads his buildings up with rod and wires poorly connected and grounded it hardly need be said that the danger from lightning losses will be greater than if the buildings were not wired at all.

In the tours of inspection over the orchard close watch should be kept for spot trees, the large limbs or the crotches of which have split down In most cases of limb damage there is little that can be done aside from propping up until fruiting time is past or cutting out at once in such way as to make the wound heal quickly In cases, however, where the split occurs in the main part of the tree the damage may be largely repaired by boring a hole through at the point of greatest vantage and inserting a bolt of the same diameter. This should be provided with washers at both ends and should be so adjusted that the thread end of the bolt will not project beyond the burr, in which case it will soon heal over. Two or three weeks after the bolts have been placed one should make another trip with a wrench and give the burrs a second tightening The writer has repaired tree damages in this manner and found the method very satisfactdry.

KILLING QUACK GRASS.

It is about the time of year when the campaign against quack grass should be started if one contemplates getting results by cultural methods. With this method it is best to let the grass grow until it blossoms. Then before any seeds mature it should be cut and the hay removed. The patch or field, as the case may be, should then be plowed to a good depth, harrowed thoroughly and in such manner as to remove as great a part of the roots from the soil as possible. The piece should then be seeded heavily to a smother crop, and for this nothing is better than millet. This should be allowed to grow until it begins to head or a trifle later and should then be plowed under to a good depth, using a heavy chain to cover the growth. The field should then be harrowed carefully and seeded rather heavily to rye. This may be pastured in the late fall and in the spring allowed to grow until time to plow for corn, when it should be plowed under as the millet was in the fall The field should be given careful cultivation and a close watch kept for any stray roots of quack grass that may have survived the treatment outlined The effectiveness of this method depends somewhat upon the character of the growing season and also upon the character and fertility of the soil.

For smaller patches other treatments have proved effective in eradicating the pest. One of these is the application of tar paper, the smothering being made the more effective by covering the joints between the strips of paper with earth. Turning hogs, with rooters in good shape on to such a piece of quack grass has also given good results. Another interesting method of extermination is reported from one of the Wisconsin experiment farms. In this case the land was infested with both quack grass and Canada thistle It was put in proper tilth and given a heavy seeding of hemp. This, growing rankly to a height of from six to eight feet, completely occupied the ground. In the fall the yield of hemp from this tract grossed more than $100 per acre, and in addition to this the thistle had been entirely killed and all but a few roots of the quack grass. This method of treatment, where possible, has an advantage over several plans that are commonly recommended in that the crop is not lost during the season in which the pest is being exterminated.

AUTOS AND MORTGAGES.

An automobile is a mighty fine thing for folks who can afford it and who have the wherewithal to meet gasoline and repair bills, but it is a delusion and a snare for those who have to mortgage their town home or farm to make the purchase and use for up keep money that should go to pay debts already incurred or to buy victuals and clothing for the family. We heard of an instance of this latter type the other day. A fellow embarked in this occupation of "keeping up with Lizzie" and mortgaged his little home to get the machine. In a couple of days he seems to have attempted to beat a train at a crossing. His car was turned to scrap iron in a twinkling, and he himself barely escaped with his life. When he came to himself he was a poorer and also a wiser man.

A TYPICAL CASE.

A single county in western Iowa Webster county, has within the past two or three years spent $1,018,588 on drainage projects done under the supervision of the county. There were all kinds of kicking by some short sighted folk when these ditches were being dug, but this has died down. As a result of the drainage facilities thus afforded thousands of acres of practically unproductive land have been reclaimed and made to produce bumper crops. The result of all this is that land values have taken a big jump, the advance more than covering the cost of the drainage system to the adjacent property owners. This instance is typical of scores of others where the same conditions existed originally and where the same transformation has taken place.

A WRONG STANDARD.

A whole lot of the worst misery in the world might be avoided if folks would throw over the misleading idea that happiness consists in things they can strive for and possess rather than in what they really are in heart and mind and life. A sincere striving to develop this latter view not only does much to create a spirit of real happiness and contentment, but along with this makes them less dependent upon favorable condition or environment for their well being. Perhaps not in centuries has there been greater need than today of the truth uttered so long ago, "A man's life consisteth not in the things which he possesseth."

"WET FEET."

Oftentimes the unhealthy appearance and condition of fruit trees are traceable to their being situated above an impervious stratum of stiff clay or hardpan that effectually prevents a seeping away of water contained in the subsoil reached by the roots of the trees. It's a case of "wet feet" and may be cured by tiling the land so as to drain off the surplus water or by drilling through the hardpan at two or three points farthest removed from the trees and exploding charges of dynamite. Unless the crust is very thick this will break it up and will allow the water to settle away

Marjory's Burglar

"I'm just miserable," sighed Marjory, "and I know I'll never be happy again."

"What's the cause of all this woe?" asked her friend Polly, sympathetically. "Tell me about it."

"That's the reason I rushed over before breakfast," said Marjory. "If I didn't confess to some one I would die. Such a load on my conscience."

"Oh, a case of guilty conscience. How many hearts has the heartless coquette broken this week?" asked Polly.

"Worse than that, Polly, I've killed a man."

"Heavens!" screamed her friend. "What do you mean? Explain."

"Well, I haven't exactly killed him outright, but the doctor says he is in a critical condition."

"Who is he? Come to the point and don't keep me in suspense."

"Well, since I've lived at this boarding house I've been kind of lonesome like, so yesterday Jane Darwin came over and stayed all night with me.

"About four in the morning I was awakened by strange noises in the hall. I shook sleeping Jane into consciousness and whispered 'Burglars!' We both sat erect in bed, breathless and listened.

"'We shall be murdered in cold blood,' groaned Jane, while I, with my usual impulsiveness, jumped out of bed, grabbed the alarm clock and flung it through the transom, smashing the glass in a thousand pieces.

"And you nearly killed the burglar?" gasped Polly.

"No, if he had been a really, truly robber I wouldn't have cared; such a deed would have been heroic. But there was no burglar. My alarm clock hit a perfectly innocent fellow boarder who was doing nothing more than entering his room, which unfortunately happened to be next to mine.

"He had no business to stay out until four in the morning. It served him right," stated Polly.

"He was returning from a business trip, a new boarder. The room had been vacant so long I completely forgot it belonged on the map of Mrs. Persimmon's select boarding house.

"Well, he happened to be a handsome, broad-shouldered, splendid young man. And, oh, Polly! that horrible alarm clock hit him square on the head and knocked him senseless."

"I guess it knocked the clock senseless, too, for its alarm started to go off and I think it's going yet.

"The noise of his fall, the ring of the clock and my screams brought the 40 boarders rushing to the scene of disaster.

"And their negligee costumes were positively indecent. If it weren't tragic it would have been excruciatingly funny to see old Mrs. Topps, with her wig in her mouth and holding her false teeth to her head.

"They carried the poor man to his bed, called the doctor, and here I am worried almost frantic. Suppose he should die? So good looking, too."

"You poor dear," said Polly. "I can imagine your anxiety, but brace up, I know he will soon recover and forgive you your unwarranted attack of assault and battery."

About four weeks later Polly said to Marjory: "By the way, how is your burglar friend?"

"He's just splendid," answered Marjory sparkling with enthusiasm.

"Then his head was not seriously injured?"

"No, his head is better, but—but he claims the blow affected his—his—heart."

"Marjory Morton, you are blushing furiously. What does it mean?"

"When Chester—I mean Mr. Ford, was convalescing I felt it my duty to help him while away the tedious hours, being that it was all my fault. Living under the same roof, naturally we saw quite a bit of each other—see?

"Then I was sorry for him. He was sorry because I was sorry, and—well—you—see—you know—I guess you understand."

"Oh, Marjory; how romantic. I'm so happy, and it's all on account of an alarm clock."

"Yes. Chester says he's going to wear that alarm clock for a watch charm after this," laughed Marjory.

Orgeat.

Orgeat—pronounced orzhat—takes its name from the French "orge," barley, and was formerly a syrup in which a decoction of that cereal was used. It has come now to mean a drink prepared with an emulsion of almonds, and is slightly medicinal as well as refreshing on a hot day. It is said to be good for hay fever, among other things. To prepare it, boil two quarts of milk with a stick of cinnamon, remove the spice and let the milk cool. Blanch four ounces of sweet almonds, and when they are cold pound them in a mortar with a little rosewater and enough orange flower water to form a paste. Sweeten the milk and boil the almond paste in it for a few moments—not too long, or the paste will be oily. Strain the beverage through a fine sieve so that it will be smooth in quality. Serve it with ice the day it is made.

Not Cured By Time.

He—I was a fool when I married you.

She—Well, don't you think it's about time for you to get over it We've been married 15 years."—Stray Stories.

The Carbon-Copy Test that Proves the Superiority of the work produced by the Monarch.

Try this experiment: Take several sheets of writing paper with carbons between; place them on a flat surface and a lead pencil, point down, from a height of 18 or 20 inc Note the clearness of the dot, even on the bottom sh Now make a dot by *pressing* the pencil into the paper, then examine your carbon copies. The top one will s clear enough but the others will be faint and blurred.

Monarch Ligh Touc

This simple demonstration illustrates the light touch prin of the Monarch Typewriter. The action of the Creeping Fulc of the Monarch type bar is such that it throws the type face aga the paper with a quick tap—not a slow push This means impressions on the maximum number of carbon copies.

Monarch "Light Touch" is more than a mere talking po It is a mechanical fact, and is one of the recognized features of Monarch Typewriter. We are always glad to demonstrate this other valuable features of the Monarch, and request those in ested to write us for illustrated, descriptive literature.

We can arrange for a demonstration of the Monarch in your own office.
